

- Complete packaged system
- Minimal space requirement
- Consistent water pressure
- Patented Smart Pressure technology
- Low pressure cut-out
- Quiet operation

APPLICATIONS

- Single & multi-family homes
- Light commercial buildings
- Irrigation systems
- Water treatment

PBS Series

Pressure Booster Systems

When water pressure is a problem, turn to the H2Pro Pressure Booster System by Flexcon Industries. Big performance from a small easy to install packaged system makes the PBS the choice of installers everywhere.

The H2Pro PBS Series features quiet, high performance centrifugal pumps designed to boost system pressure by as much as 40PSI. A small diaphragm tank stores water under pressure to help reduce nuisance cycling. The system is controlled by an adjustable pressure switch with low pressure cut-out to protect the pump.

At the heart of the H2Pro booster system is the patented Smart Pressure valve. This innovative product keeps the pump running during the demand period thus reducing pump starts and leading to longer pump life. All this is done mechanically without costly, confusing electronics. More importantly, the Smart Pressure valve allows the system to deliver constant pressure at any given flow rate.

Flexcon Industries has long been known for high quality innovative products and the H2Pro Pressure Booster System is the latest in that long line.
